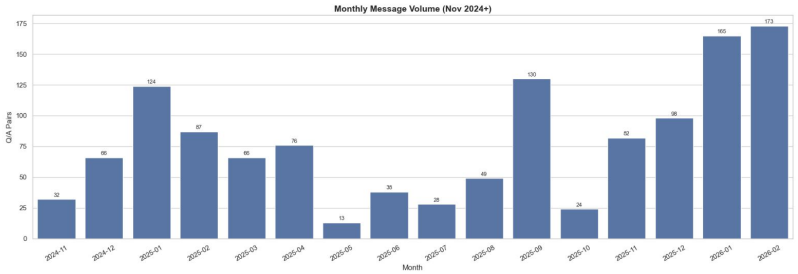
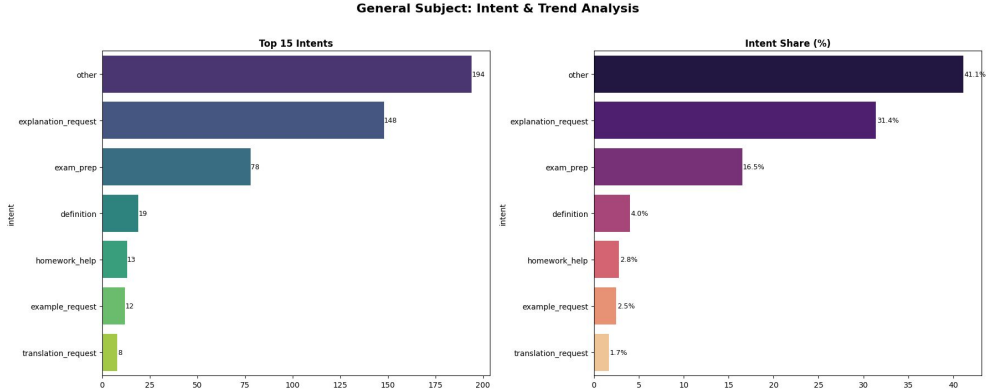
RE Update - 20th March

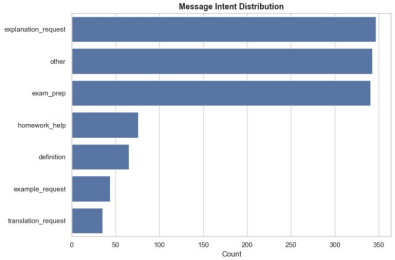
Message and LBA question review

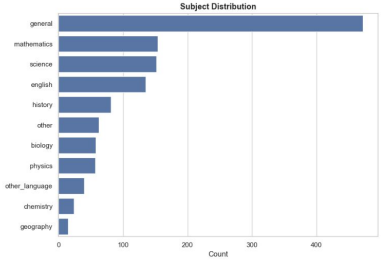
‘Message’ collection audit

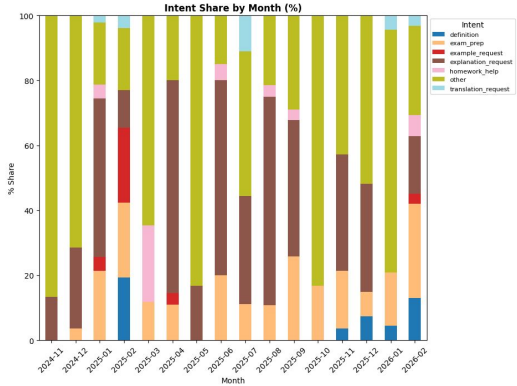
- To understand user intention and its cohesion with LLM outputs.
- Done using Batch Processing + Gemini API integration - 1.5-flash and 2.5-flash-lite (functionally identical in prompt classification)
- Time-Series, message intent and subject analysis.
- Language Split: 92-8 English-Kannada. Negligible Telugu (<0.1%)

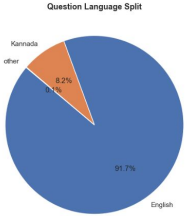












Subject Analysis reveals that the LLM is being used majorly as a general chat interface - users view the LLM as a chatbot as much as an assistance tool.

‘lba_question’ DB Processing

- JSONs were read, extracted as nested dictionary as per usual.
- Join performed on the ‘chapters’ collection to extract information on that.
- Text was normalised and standardised.
- Joined dataframe saved to a .CSV file.

Question Quality Audit

- Questions were split by subject, chapter and then grade. These were then text-matched to the LBA Question bank PDFs found on the DSERT website.
- An interesting observation to note is that the chapters that questions were asked for came primarily from English as a Second Language, despite approximately half the schools having English as the primary medium.
- Indeed, there were no questions for chapters from First Language - English.
- Text matching was performed with fuzzy logic, with 50% chosen as a threshold (more matched than not).
-
